what is laser tv laser color television or laser color video display utilizes two or more individually modulated optical laser rays of different colors to produce a combined spot that is scanned and projected across the image plane by a polygon mirror system or less effectively by optoelectronic means to produce a color television display the systems work either by scanning the entire picture a dot at a time and modulating the laser directly at high frequency much like the

electron beams in a cathode ray tube or by optically spreading and then modulating the laser and scanning a line at a time the line itself being modulated in much the same way as with digital light processing dlp how you will benefit i insights and validations about the following topics chapter 1 laser tv chapter 2 plasma display chapter 3 home cinema chapter 4 flat panel display chapter 5 lcd projector chapter 6 gamut chapter 7 liquid crystal on silicon chapter 8 video projector chapter 9 digital light processing chapter 10 television set chapter 11 lcd television chapter 12 handheld projector chapter 13 comparison of display technology chapter 14 active shutter 3d system chapter 15 wobulation chapter 16 crt projector chapter 17 large screen television technology chapter 18 rear projection television chapter 19 electronic visual display chapter 20 digital micromirror device chapter 21 3lcd ii answering the public top questions about laser tv iii real world examples for the usage of laser tv in many fields iv 17 appendices to explain briefly 266 emerging technologies in each industry to have 360 degree full understanding of laser tv technologies who this book is for professionals undergraduate and graduate students enthusiasts hobbyists and those who want to go beyond basic knowledge or information for any kind of laser tv

diploma thesis from the year 2006 in the subject communications research studies enquiries grade 1 university of weimar language english abstract reconstruction of real world scenes from a set of multiple images is a topic in computer vision and 3d computer graphics with many interesting applications there exists a powerful algorithm for shape reconstruction from arbitrary viewpoints called space carving however it is computationally expensive and hence can not be used with applications in the field of 3d video or cscw as well as interactive 3d model creation attempts have been made to achieve real time framerates using pc cluster systems while these provide enough performance they are also expensive and less flexible approaches that use gpu hardware acceleration on single workstations achieve interactive framerates for novel view synthesis but do not provide an explicit volumetric representation of the whole scene the proposed approach shows the efforts in developing a gpu hardware accelerated framework for obtaining the volumetric photo hull of a dynamic 3d scene as seen from multiple calibrated cameras high performance is achieved by employing a shape from silhouette technique in advance to obtain a tight initial volume for space carving also several speed up techniques are presented to increase efficiency since the entire processing is done on a single pc the framework can be applied to mobile setups enabling a wide range of further applications the approach is explained using programmable vertex and fragment processors with current hardware and compared to highly optimized cpu implementations it is shown that the new approach can outperform the latter by more
